### Report Overview

Ship trim optimization principles are based on the fact that ship experiences different (more or less) resistance through water for the same speed and draft depending on its trim. Ship trim optimization simply advocates selecting the trim condition for minimum resistance. The resistance through water is then proportional to the amount of required power and governs the required fuel burn rate. Hence, less resistance implies fewer emissions and more economical operation by fuel savings.

The global Ship Trim Optimization Systems market size was estimated at USD 127.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
