## Abstracts

Short oil alkyd resins are a class of synthetic polymers derived from the polycondensation of polyhydric alcohols, polybasic acids, and fatty acids, where the fatty acid content constitutes less than 40% of the total resin composition; these resins are characterized by their relatively low oil length, which imparts properties such as faster drying times, higher hardness, improved chemical resistance, and superior durability compared to medium or long oil alkyds, making them particularly suitable for industrial coatings, automotive finishes, and high-performance enamel applications where a tough, protective film is required.

The global Short Oil Alkyd Resins market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
