Abstracts

Shrinkage reducing agents (SRAs) are chemical admixtures used in concrete and cementitious materials to mitigate drying shrinkage, which occurs as water evaporates from the hardened concrete over time, thereby reducing the risk of cracking, improving durability, and enhancing long-term structural integrity. These agents function by modifying the capillary tension and pore structure within the concrete matrix, often through hydrophobic or crystalline mechanisms, and are commonly based on polyglycol ethers, alkali metal salts, or other specialty organic compounds. They are particularly vital in applications where dimensional stability is critical, such as in slabs, pavements, bridges, and high-performance architectural elements, offering an engineered solution to counteract inherent volumetric changes without compromising other concrete properties like strength or workability.

The global Shrinkage Reducing Agents market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
