Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Si-based Hall Effect Sensors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Si-based Hall Effect Sensors are magnetic field sensing devices fabricated using silicon (Si) semiconductor materials, which operate based on the Hall effect principle. When an electric current flows through a silicon conductor or semiconductor plate and a perpendicular magnetic field is applied, the Lorentz force deflects charge carriers (electrons or holes), generating a measurable Hall voltage across the transverse sides of the material. These sensors convert the magnetic field strength into an electrical signal, enabling applications such as position detection, speed measurement, current sensing, and proximity switching. Compared to compound semiconductor Hall sensors (e.g., GaAs or InSb), Si-based Hall sensors offer advantages such as lower cost, easier integration with CMOS circuits, and better compatibility with standard semiconductor manufacturing processes. However, they typically exhibit lower electron mobility, resulting in reduced sensitivity and higher temperature drift, making them more suitable for cost-sensitive, medium-precision applications in automotive, industrial, and consumer electronics.

The global Si-based Hall Effect Sensors market size was estimated at USD 1978.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
