Abstracts

The manufacturing process of silicon carbide (SiC) materials usually starts with the preparation of ingots. After this step, the ingots will be precisely sliced, carefully ground and polished, and finally transformed into high-quality silicon carbide substrates. These substrates, as key basic materials, are further formed on their surfaces through epitaxial growth technology to form a uniform and high-quality silicon carbide epitaxial wafer. In the manufacturing process of silicon carbide epitaxial wafers, silicon carbide (SiC) deposition equipment plays a vital role. This equipment can uniformly deposit a layer of silicon carbide film on the surface of the substrate through precisely controlled chemical reactions under specific process conditions. The deposition process requires not only high precision and stability, but also the purity and structural integrity of the film to meet the high standards of subsequent device manufacturing. After the epitaxial wafer is prepared, it will enter a more complex device manufacturing stage. This process includes multiple key steps such as lithography, etching, ion implantation and deposition, each of which requires high-precision process control to ensure the performance and reliability of the final device.

The global SiC Deposition Equipemnt market size was estimated at USD 215.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
