Report Overview

Silicon carbide substrates have many defects and cannot be processed directly. A specific single crystal thin film needs to be grown on them through an epitaxial process to make chip wafers. This thin film is the epitaxial layer. Epitaxy is in the middle of the industrial chain and plays a very critical role. On the one hand, the quality of the epitaxial layer will be affected by the quality of the crystal and substrate processing. On the other hand, all devices basically need to be realized on epitaxy. The quality of epitaxy has a decisive influence on the performance and yield of the device. The epitaxy process can be carried out in a foundry manner, that is, specialized epitaxial manufacturers produce these films for other companies. This service usually involves high-precision material growth, process control and quality assurance, and is used to produce high-performance electronic devices such as power devices, radio frequency devices and optoelectronic devices.
