Abstracts

As a kind of high-voltage small accelerator, the function of the ion implanter is to extract the required ions from the ion source and accelerate them to reach an energy of several hundred kiloelectron volts to form an ion beam. This ion beam plays an important role in semiconductor materials, large-scale integrated circuits and device manufacturing. It is also widely used in the fields of metal material surface modification and film making. In particular, SiC (silicon carbide) ion implanters can achieve precise directional doping of SiC materials, effectively change material properties, and construct specific structures with their high efficiency, precise control and excellent repeatability. Therefore, SiC ion implanters have been widely and deeply used in the fields of SiC material research and SiC device preparation. For silicon carbide, in the doping process, the use of ion implantation can achieve better results than high-temperature diffusion process. The ion implantation machine used for silicon carbide wafers is generally a high-temperature and high-energy type, with high equipment cost and long equipment delivery time. Globally, there are not many companies that can provide SiC ion implantation machines. The current leader is mainly Axcelis, whose Purion XE series high-energy equipment can meet the requirements of 150mm and 200mm SiC wafers. In China, local companies that produce silicon carbide ion implantation machines mainly include CETC, Foshan Jihua and Qingdao Sifang Sri Intellectual Technology, among which Qingdao Sifang Sri Intellectual Technology's models are mainly SR11-4.5M SiC (high energy) and SR11-200 SiC (medium energy).

The global SiC Ion Implanters market size was estimated at USD 746.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
