Abstracts

SiC-MOSFETs and GaN-MOSFETs, the next generation power devices, have very low loss during high-frequency switching operation, enabling the downsizing of passive components without compromising the conversion efficiency of the system. For this reason, SiC-MOSFETs and GaN-MOSFETs are attracting attention as next-generation power devices, and are beginning to be used in a wide range of applications, including power supplies for EVs and servers, industrial equipment, UPS (uninterruptible power supplies), and Photovoltaic Power conditioner. The transition from Si to SiC and GaN power devices will allow for higher power capacity and higher switching frequency ranges. Disruptive new applications, like electric vehicles (EVs) and energy storage systems (ESS), are creating demand for ultra-efficient, high power density, high frequency SiC power converters. On-board traction motor drives are looking at the highest power density to reduce size and weight and gain new efficiency records, while off-board fast chargers are seeking for high voltages (up to 2000 VDC, >150 kW) and complex high frequency topologies, resulting in a total system cost reduction on magnetics, mechanics, and assembly. On top of that, these new applications are also pushing the developments of innovative, multicore control processors, and are able to manage complex control algorithms and assure system efficiency and stability when working in bidirectional mode from the ac grid to the dc load and vice versa.

The global SiC and GaN Gate Drivers market size was estimated at USD 561.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
