### Report Overview:

Silicon carbide (SiC) was discovered in 1893 as an industrial abrasive for grinding wheels and automotive brakes. The scheme of laser cutting silicon carbide is laser modified cutting technology. The principle is to use a laser beam with a high transmission wavelength to focus on the inside of the wafer through a lens, and multiphoton absorption occurs, resulting in a local deformation layer, namely modified layer. The layer is mainly composed of holes, high dislocation density layers and cracks. The modified layer is the starting point of subsequent wafer dicing and cracking. The modified layer can be confined inside the wafer by optimizing the laser and optical path system, and no thermal damage is caused to the surface and bottom of the wafer. Then, use external force to guide the cracks to the surface and bottom of the wafer, separating the wafer into the required size.

The Global SiC Wafer Laser Cutting Equipment Market Size was estimated at USD 120.85 million in 2023 and is projected to reach USD 299.03 million by 2029, exhibiting a CAGR of 16.30% during the forecast period.
