## Abstracts

The signal conditioner is a key device between the signal source and the readout device. The signal conditioner receives the input signal and converts it into a signal that is proportional to the input, and then outputs it to other devices. In addition to its isolation and anti-interference functions, it also supports signal conversion, signal distribution, and providing working power to the transmitter. The main purpose of the signal conditioner is to amplify the signal and convert it into a form that is easy to identify and compatible with data acquisition or machine control, thereby improving the accuracy of the measurement, which is essential for high-precision data acquisition and machine control. The signal conditioner mainly includes components such as signal converters, amplifiers (such as voltage amplifiers, charge amplifiers), filters, differentiators and integrators, power supplies and cables. According to the different power supply methods, signal conditioners can be divided into active signal conditioners and passive signal conditioners. Active signal conditioners need to provide a separate power supply. Common power supplies are DC24V and AC220V, and 85~265V AC and DC universal power supplies can also be selected.

The global Signal Adapter market size was estimated at USD 711.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
