Abstracts

Signal chain ICs are key components used in electronic systems to process and transmit analog signals. They are widely used in communications, industrial control, medical equipment, and consumer electronics. The main function of this type of IC is to obtain weak analog signals from sensors, and after a series of processing such as amplification, filtering, and analog-to-digital conversion (ADC), they ultimately provide high-quality digital signals to digital processors. Signal chain ICs typically include components such as operational amplifiers (Op Amp), comparators, analog switches, and programmable gain amplifiers (PGA) for initial signal amplification and conditioning. These components can effectively increase the amplitude of the input signal and reduce noise interference to ensure the accuracy of subsequent processing. The analog-to-digital converter (ADC) converts the conditioned analog signal into a digital format for further analysis and processing by a digital signal processor (DSP) or microcontroller (MCU).

The global Signal Chain ICs market size was estimated at USD 12820.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
