Abstracts

Silane crosslinking agents are a class of organosilicon compounds, primarily alkoxysilanes such as vinyltrimethoxysilane or methacryloxypropyltrimethoxysilane, which facilitate the crosslinking of polymers through hydrolysis and condensation reactions when exposed to moisture. These agents are widely used to enhance the thermal, mechanical, and chemical resistance of materials like polyethylene, enabling applications in wires, cables, pipes, and adhesives where durability and performance under stress or environmental exposure are critical. Their function relies on forming stable siloxane bonds between polymer chains, resulting in a three-dimensional network that improves material properties without requiring high-energy radiation or peroxides, making them especially valuable in industries prioritizing efficiency and safety.

The global Silane Crosslinking Agent market size was estimated at USD 480.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
