Abstracts

Silicon dioxide has the characteristics of small particle size, large specific surface area, and rich hydroxyl groups on the surface. It is often used in the granulation of tablets, oils, and extracts, and is commonly used as a lubricant, anti adhesive, adsorbent, anti-static agent, sustained-release formulation, grinding aid, crystal stability promoter, colon targeted formulation, etc. Using porous silica as a carrier to adsorb drug molecules from solvents into tablets enhances tablet hardness and prevents material from adhering to the punch. It also facilitates easier dissolution of the tablets when in contact with the dissolution medium, accelerating the dissolution rate of the drug. With the continuous advancement of medical technology, the demand for efficient drug delivery systems is increasing. Traditional drug carriers have limitations in terms of stability, targeting, and biocompatibility, which restrict the therapeutic effect. Nano silica has become a research hotspot in the field of drug carriers due to its unique physical and chemical properties and biocompatibility. It can effectively improve the stability of drugs and ensure long-lasting efficacy; At the same time, it accurately targets the lesion site, reduces damage to normal tissues, and thus reduces side effects. In addition, nano silica also has good biocompatibility and degradability, which helps to reduce the metabolic burden on patients.

The global Silica Excipients market size was estimated at USD 476.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
