Abstracts

Silica fume admixtures, also known as microsilica, are ultrafine, amorphous silicon dioxide powders used as supplementary cementitious materials in the production of high-performance concrete and specialized cement-based composites. Derived as a byproduct of silicon and ferrosilicon alloy production, these admixtures enhance concrete properties by filling microscopic voids between cement particles, resulting in significantly improved compressive strength, durability, abrasion resistance, and reduced permeability to water and chlorides. They are particularly valued in applications demanding extreme structural integrity and longevity, such as marine structures, high-rise buildings, bridge decks, industrial flooring, and infrastructure exposed to aggressive environmental conditions.

The global Silica Fume Admixtures market size was estimated at USD 106.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
