Abstracts

Silica gel thin layer chromatography (TLC) plate is a type of stationary phase used in thin layer chromatography, a technique used to separate and analyze compounds in complex mixtures. TLC is an analytical technique used to separate components of a mixture based on their polarity, size, and other physicochemical properties. The silica gel thin layer chromatography plate consists of a thin layer of silica gel coated onto a glass or plastic plate. The silica gel layer is highly porous, with a large surface area, which makes it ideal for separating compounds based on their relative polarity. The sample mixture is spotted onto the silica gel TLC plate, and then the plate is placed in a solvent system, which moves the compounds up the plate. The different compounds move at different rates, depending on their polarity, and can be visualized using various methods such as UV light or staining. Silica gel TLC plates are widely used in the pharmaceutical and biotechnology industries, as well as in forensic analysis, environmental testing, and food testing. They are available in different sizes and configurations, depending on the application and the type of analysis required.

The global Silica Gel Thin Layer Chromatography Plate market size was estimated at USD 245.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
