Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Silica Ramming Mass competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Silica ramming mix is an unshaped refractory material used for lining high-temperature industrial equipment, primarily formed through ramming to create a dense lining. The upstream of the silica sand ramming mix industry chain uses high-purity silica sand as the core raw material, and its supply and cost directly affect midstream production. Downstream applications are concentrated in the foundry industry (such as molding sand cores and mold working surfaces) and the metallurgical industry (such as furnace lining repair and ramming layers for induction furnaces and converters). Global sales in 2024 were approximately 900,000 tons, with an average market price of approximately US\$240 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of the production equipment, with industry gross profit ranging from 15% to 30%.

The global Silica Ramming Mass market size was estimated at USD 216.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
