Report Overview:

Silicon has been recognized as a one of the most promising anode materials to replace currently used graphite in the anodes of Li-ion batteries due to its high gravimetric theoretical lithium storage capacity. Fast charging is feasible due to the high porosity inherent to silicon anode solutions, while costs can be reduced because of silicon materials' high capacity, which results in lower material requirements. Silicon anodes are also considered safer because they help reduce the risk of lithium plating and dendrite formation, even though cycle and calendar life may need to be further demonstrated.

The Global Silicon Anode Materials Market Size was estimated at USD 540.12 million in 2023 and is projected to reach USD 4409.44 million by 2029, exhibiting a CAGR of 41.90% during the forecast period.
