Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Silicon Based Inoculants competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Silicon-based inoculants are industrial additives used in the casting process. Their main component is silicon, and they are often combined with other elements (such as barium, calcium, aluminum, and rare earth elements). Their function is to improve the microstructure and mechanical properties of cast iron. They enhance the strength and machinability of castings by promoting graphitization, increasing eutectic clusters, refining grains, and suppressing the tendency for white iron formation. The upstream sector includes basic alloys such as ferrosilicon, as well as elements like barium, strontium, zirconium, and calcium. Producers use processes such as smelting, alloying, crushing, and screening to create alloys with different compositions (e.g., barium silicon, calcium silicon, zirconium silicon) and particle sizes. The downstream sector is primarily concentrated in the foundry industry. Global sales in 2024 were approximately 820,000 tons, with an average market price of approximately \$1,000 per ton. The scale of single-line production capacity varies depending on production processes and investment levels. Industry gross profit margins range from 20% to 35%.

The global Silicon Based Inoculants market size was estimated at USD 820.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
