Abstracts

Silicon-based LED technology is a technology that generates countless micron-sized LEDs on a silicon substrate. Due to its brightness advantage, this technology is regarded as the future of micro-displays for VR, XR, and MR devices. The current blue light quantum dot silicon-based LED technology forms a blue LED light-emitting layer on the CMOS panel or the back, and then covers it with different quantum dot materials to convert blue light into red and green light; there is a microlens at the top of the pixel to enhance the brightness. Another three-color light-combining technology is to use a combination of independent silicon-based R, G, and B light-emitting bodies, which are arranged vertically to each other, but this technology requires waveguide elements to control the direction of light. The most ideal way is a monolithic silicon-based LED panel, where the three light-emitting bodies R, G, and B can be deposited together on the surface of a CMOS or glass substrate, but this requires a high-temperature epitaxial process for manufacturing.

The global Silicon-based Micro-LED market size was estimated at USD 1093.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 23.50% during the forecast period.
