## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Silicon-based Micro-OLED competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Micro-OLED uses single-crystal silicon semiconductor as substrate, integrates tens of millions of transistors to form CMOS driving circuit, and evaporates OLED organic materials on the CMOS driving circuit to form light-emitting diodes, which can perfectly realize high-resolution and tiny-sized micro-display devices. Micro-OLED micro-displays are less than 1 inch in size and are a sub-category of OLED displays. OLED displays can be divided into passive and active types according to the driving mode, large, medium and small sizes and micro-displays according to the screen size, and glass substrates, silicon substrates, flexible substrates, etc. according to the different substrates. Due to the difference in PPI pixel circuits, micro-sized Micro-OLED displays generally use silicon substrates, while small, medium and large-sized OLEDs usually use glass substrates or flexible substrates. Silicon-based Micro-OLED micro-display devices have the characteristics of self-luminescence, thin thickness, light weight, large viewing angle, short response time, and high luminous efficiency. They are easy to achieve excellent characteristics such as high PPI pixel density and low power consumption, and are very suitable for near-eye display devices such as VR, electronic sights, night vision devices, etc. Silicon-based Micro-OLED is an active light-emitting diode display device that combines CMOS semiconductor technology with OLED display technology and uses single-crystal silicon as the active driving backplane. Silicon-based Micro-OLED integrates electronic technology, optical technology, material technology, semiconductor technology, etc., and involves two major national key development areas, semiconductor and OLED display, and is strongly supported by national policies. Silicon-based OLED not only has the advantages of OLED display, but

also has the advantages of advanced semiconductor technology and high integration.

The global Silicon-based Micro-OLED market size was estimated at USD 1153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.30% during the forecast period.
