## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Silicon Based Precursor for Semiconductor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Silicon based precursors for semiconductor are key gas-phase chemical raw materials used to deposit silicon-containing films in the chip manufacturing process. They are a class of highly volatile silicon-containing compounds that decompose or react under high temperature or plasma activation through chemical vapor deposition (CVD), atomic layer deposition (ALD) and other technologies, and precisely deposit silicon elements on the surface of the wafer to form core functional films such as single crystal silicon, polycrystalline silicon, silicon dioxide (SiO<sub>2</sub>), silicon nitride (SiN<sub>x</sub>), and silicon carbide (SiC), thereby constructing chip structures such as transistor gates, dielectric isolation layers, and packaging protection layers. Its ultra-high purity (metal impurities are below the ppt level) and controllable reaction characteristics directly affect chip performance and yield, and are the "chemical cornerstone" of semiconductor manufacturing.

The global Silicon Based Precursor for Semiconductor market size was estimated at USD 668.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
