Silicon-based Raman lasers represent a specialized category of optoelectronic devices that leverage the Raman scattering effect within silicon waveguides or resonators to generate coherent light, differing fundamentally from conventional lasers by utilizing stimulated Raman scattering rather than electron-hole recombination for optical gain, which allows operation at wavelengths not easily accessible with traditional laser diodes and benefits from silicon's high Raman gain coefficient, optical nonlinearity, and compatibility with existing CMOS fabrication processes, enabling potential integration with electronic and photonic circuits for applications in telecommunications, spectroscopy, and sensing.
