Abstracts

Silicon Cast Iron Anode is a material used for electrochemical protection, mainly used to prevent metal structures from corrosion in corrosive environments. It is composed of iron (Fe) and silicon (Si) as the main components, and other small amounts of alloying elements (such as carbon, manganese, etc.) are added to improve its mechanical and electrochemical properties. The silicon content is usually between 12% and 30%, and the silicon content will be adjusted according to specific application requirements. Silicon cast iron anode sacrifices itself through electrochemical reactions to protect the protected metal structure. It has a lower potential in a corrosive environment and can be corroded preferentially, thereby preventing the protected metal from corrosion. The main advantages of silicon cast iron anodes are their corrosion resistance, high mechanical strength, and suitability for a variety of environments (such as seawater, soil, etc.).

The global Silicon Cast Iron Anode market size was estimated at USD 201.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
