## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Silicon Digital Attenuator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The silicon digital attenuator is a radio frequency device that uses semiconductor technology to achieve digitally controlled attenuation, enabling precise adjustment in fixed steps across a wide frequency range. It features compact size, high integration, fast response, and strong consistency, and is widely used in communications, radar, and testing equipment. With the growing demand for high-frequency communications and intelligent applications, the market is developing steadily, though overall expansion remains limited. In 2024, the production of silicon digital attenuators was 1.43 million units, with an average price of 105 USD per unit. In 2024, a single silicon digital attenuator production line had an annual capacity of about 1000 units, with an average gross margin of 35%. The industry chain of silicon digital attenuators includes upstream semiconductor materials, wafer fabrication, and RF circuit design; midstream processes of chip manufacturing, packaging, and testing; and downstream applications across both military and commercial sectors, with military uses in radar and satellite communications and commercial uses in base stations, mobile communications, and testing equipment, forming a complete industry chain.

The global Silicon Digital Attenuator market size was estimated at USD 150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
