Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Silicon Membranes for Stencil Mask competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Silicon Membranes for Stencil Mask production reached approximately 165,472 units, with an average global market price of around US\$ 15.61 per unit. A Silicon Stencil Mask (SSM) is a high-precision photomask technology used in semiconductor manufacturing, particularly for extreme ultraviolet (EUV) and advanced lithography processes. Unlike conventional quartz-based photomasks, an SSM is made from single-crystal silicon and features extremely thin, durable stencil-like openings that allow direct projection of EUV light patterns onto wafers. This structure eliminates some of the reflection and multi-layer complexity found in traditional masks, thereby improving pattern fidelity, resolution, and defect control. The upstream segment focuses on raw silicon wafers and processing materials required to fabricate ultra-thin, defect-free silicon membranes. Key inputs include high-purity single-crystal silicon (300 mm and below), photoresists, etching gases (SF₆, Cl₂), and deposition materials. Suppliers such as Shin-Etsu, SUMCO, Siltronic, and GlobalWafers provide high-grade wafers, while chemical suppliers like Merck and JSR support lithography and etching. The midstream consists of specialized manufacturers that process wafers into ultra-thin silicon membranes with uniform thickness, mechanical stability, and EUV transparency. This involves deep reactive-ion etching (DRIE), chemical-mechanical polishing (CMP), and stress-control techniques. Companies like Toppan, DNP (Dai Nippon Printing), Hoya, and Applied MicroSwiss integrate these membranes into stencil masks used in advanced semiconductor lithography. The downstream application is driven by semiconductor fabs and equipment suppliers that use stencil masks for EUV and next-generation lithography at sub-5nm nodes. Major end-users include TSMC, Samsung,

Intel, and Micron, along with lithography tool providers like ASML. The demand is tied to the scaling roadmap, where thinner, more precise silicon membranes directly influence pattern fidelity, defect control, and yield in advanced chips.

The global Silicon Membranes for Stencil Mask market size was estimated at USD 61.64 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
