Abstracts

Silicon nanowires (SiNWs) are one-dimensional nanostructures with diameters on the nanometer scale and lengths that can extend to micrometers, exhibiting unique electrical, optical, and mechanical properties due to quantum confinement effects and high surface-to-volume ratios. These characteristics make them highly suitable for a variety of advanced applications, including high-performance lithium-ion battery anodes, where they accommodate large volume expansion during cycling; field-effect transistors and nanoelectronics, due to their excellent charge carrier mobility and gate controllability; highly sensitive sensors for biological and chemical detection, leveraging their surface reactivity; and photovoltaic devices, where they enhance light absorption and charge collection efficiency. The synthesis methods?such as vapor-liquid-solid growth, metal-assisted chemical etching, and solution-based techniques?allow for precise control over dimensions, crystallinity, and doping, tailoring SiNWs for specific technological needs across electronics, energy storage, and biomedical fields.

The global Silicon Nanowires (Sinws) market size was estimated at USD 122.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.45% during the forecast period.
