Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Silicon Oxynitride competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Silicon Oxynitride is a ceramic compound composed primarily of silicon (Si), oxygen (O), and nitrogen (N), typically represented by the general formula SiO_xN_y . It exists in both amorphous and crystalline forms, depending on the synthesis conditions and composition. Structurally, silicon oxynitride can be thought of as a hybrid between silicon dioxide (SiO_2) and silicon nitride (Si_3N_4), offering properties that are intermediate between the two. It is valued for its high hardness, thermal stability, chemical resistance, and dielectric properties, making it widely used in microelectronics, photonic devices, biomedical implants, and protective coatings. In the semiconductor industry, it is often used as a dielectric layer, diffusion barrier, or optical waveguide material. Its tunable refractive index and compatibility with silicon processing technologies make it especially attractive in integrated photonics and CMOS-compatible optical components. Silicon Oxynitride (SiON) is a tunable compound with properties intermediate between silicon dioxide (SiO_2) and silicon nitride (Si_3N_4), characterized by a refractive index ranging from 1.45 to 2.0, dielectric constants between 4 and 8, and electrical resistivity up to 10^{12} Ωcm . Its mechanical properties include a hardness of $10\text{--}20$ GPa, Young's modulus between $150\text{--}250$ GPa, and density around $2.4\text{--}3.1$ g/cm³, depending on nitrogen content. Thermally, it can withstand temperatures up to $\sim 800^\circ\text{C}$ in film form and over 1600°C in ceramic form, with low thermal expansion ($\sim 2\text{--}4 \times 10^{-6}/\text{K}$). SiON films, typically deposited by PECVD or LPCVD, can be engineered to exhibit low stress (< 500 MPa), good chemical resistance, and controlled etch rates—making them ideal for use in optical coatings, dielectric layers, passivation films, waveguides, and structural ceramics in MEMS and biomedical applications.

The global Silicon Oxynitride market size was estimated at USD 1284.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
