Abstracts

A silicon pin photodiode is a semiconductor device designed for the detection of light, particularly in the visible to near-infrared spectrum, by utilizing a p-type/intrinsic/n-type (pin) junction structure that enhances performance through a wider depletion region, enabling higher quantum efficiency, faster response times, and improved linearity compared to standard pn-junction photodiodes. This intrinsic layer reduces junction capacitance and increases carrier drift velocity, making these devices well-suited for applications requiring precise light measurement, such as in optical communication systems, medical instrumentation, environmental sensing, industrial automation, and consumer electronics like barcode scanners and light barrier systems.

The global Silicon Pin Photodiode market size was estimated at USD 280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
