Report Overview

Silicon pressure sensors are made using the piezoresistive effect of single crystal silicon. Four semiconductor resistors of equal value are diffused in a specific direction of the silicon diaphragm and connected to form a Wheatstone bridge as the sensitive element of the force-to-electric converter. When the diaphragm is subjected to external pressure and the bridge loses its balance, if an excitation power supply (constant current and constant pressure) is applied to the bridge, an output voltage proportional to the measured pressure can be obtained, so as to achieve the purpose of measuring pressure.
