## Abstracts

Silicon wafers are the substrate material for semiconductors and are used in all kinds of devices, from smartphones, home appliances, automobiles and other devices that we see in our daily lives, to cutting-edge fields such as AI and IoT. This report studies the semiconductor silicon wafers for memory devices. Memory chips store information. There are two types of Memory: volatile and non-volatile. Volatile Memory chips, such as DRAM (Dynamic Random Access Memory), are the "working memory" chips that save data only while the device's power is turned on. Non-volatile Memory chips such as NAND Flash save data even after the device is turned off. For example, DRAM helps to run programs on your device, whereas NAND stores your photos. Whereas DRAM is fast, NAND is slow to read and write data.

The global Silicon Wafer for Memory Devices market size was estimated at USD 5712.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
