Report Overview

A silicone defoamer for oil and gas is a substance that is used to prevent the formation of foam in oil and gas production and processing operations. Silicone defoamers work by breaking down the surface tension of the foam, which causes it to collapse. They are typically added to the oil or gas stream during production or processing. Silicone defoamers are a type of surfactant, which means that they have both hydrophilic (water-loving) and hydrophobic (water-repelling) properties. This allows them to attach to the surface of the foam bubbles and break them down.
