Report Overview

Heat conduction interface material is a heat dissipation auxiliary material that can reduce the contact thermal resistance between the equipment heat source and the radiator, increase the heat transfer rate between them, and improve the heat dissipation effect of the equipment. Generally, the heat conduction interface material is filled between the radiator and the heat source to remove the air in the gap and fill the gap hole, playing the role of insulation, shock absorption, and sealing. The Thermal interface material without small molecule siloxane fundamentally eliminates the volatilization of silicone oil and will not pollute optical devices, which is very suitable for the optical device industry.
