Abstracts

Silicone-free thermal pads are thermally conductive interface materials designed to facilitate heat transfer between electronic components and heat sinks or other cooling solutions, but they differ from traditional silicone-based thermal pads by utilizing alternative polymer matrices such as polyurethane, acrylic, or hydrocarbon-based materials to avoid the potential drawbacks of silicone, such as oil bleed-out, surface contamination, or incompatibility with sensitive optical or electrical components. These pads often prioritize properties like low compression set, high dielectric strength, and resistance to pump-out in high-vibration environments, while maintaining thermal conductivity levels comparable to silicone-based alternatives, typically ranging from 1 to 12 W/mK.

The global Silicone Free Thermal Pad market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
