Abstracts

Silicone offers better temperature obstruction at both low and high temperatures in contrast with other rubbers. It can withstand a lower temperature limit of up to - 40C and higher temperature limit of up to 150C. The temperature resistant property displayed by silicone augments its application scope in electric vehicles. These helpful properties of silicone are probably going to drive the demand in various structures for use in electric vehicles over the coming years. In any case, natural rubber substitutes are anticipated to represent a danger to the demand for silicone, which may test the utilization of the items in electric vehicle. The use of silicone in electric vehicles (EVs) has been gaining traction and is expected to play a significant role in the development and growth of the EV market. Silicone, a versatile and durable material, offers several important properties and advantages for various components and systems within electric vehicles. One of the key applications of silicone in EVs is in battery technology, where it is used for thermal management and protection. Silicone-based thermal interface materials and adhesives are utilized to manage heat dissipation and to ensure the efficient and safe operation of EV batteries. As the demand for high-performance, long-lasting batteries continues to rise, the use of silicone in this area is expected to grow. Silicone is also used in the production of electric vehicle components, such as seals, gaskets, and insulators. Its excellent resistance to extreme temperatures, chemicals, and environmental factors make it an ideal choice for ensuring the longevity and reliability of various EV components. In addition to these applications, silicone is increasingly being utilized in EV charging infrastructure, including cable insulation, connector seals, and high-voltage insulators. As the EV charging network expands, the demand for durable and reliable silicone-based solutions is expected to increase. Furthermore, the growing focus on lightweighting and efficiency in EVs has led to the use of silicone-based materials for aerodynamic components, such as seals and gaskets, to improve vehicle performance and energy efficiency.

The global Silicone in Electric Vehicles market size was estimated at USD 6745.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.80% during the forecast period.
