Report Overview:

Silicon-On-Insulator (SOI) is a semiconductor fabrication technique developed by IBM that uses pure crystal silicon and silicon oxide for integrated circuits (ICs) and microchips. An SOI microchip processing speed is often 30% faster than today's complementary metal-oxide semiconductor (CMOS)-based chips and power consumption is reduced 80%, which makes them ideal for mobile devices. SOI chips also reduce the soft error rate, which is data corruption caused by cosmic rays and natural radioactive background signals.

Silicon-On-Insulator (SOI) is a new type of starting material for the chip making process. SOI wafers have three layers; a thin surface layer of silicon (from a few hundred Angstrom to several microns thick) where the transistors are formed, an underlying layer of insulating material on a support or "handle" bulk silicon wafer. The insulating layer, usually made of silicon dioxide, is referred to as the "buried oxide" or "BOX", and is usually a few thousand Angstroms thick. Transistors built within the top silicon layer, switch signals faster, run at lower voltages, and are much less vulnerable to signal noise from background cosmic ray particles. Each transistor is isolated from its neighbor by a complete layer of silicon dioxide. These transistors are immune to "latch-up" problems and can be spaced closer together than transistors built on bulk silicon wafers. Building circuits on SOI increases Fab productivity by allowing for more compact circuit designs, yielding more chips per wafer.

SOI enables increased chip functionality without the cost of major Fab process equipment changes. Faster circuit operation and lower operating voltages have produced a powerful surge in the performance of high-speed network servers and new

designs for hand-held computing and communication devices with longer battery life. Advanced circuits, using multiple layers of SOI-type device silicon, can lead the way to a coupling of electrical and optical signal processing into a single chip resulting in a dramatic broadening of communication bandwidth and new applications such as global-ranging, direct-link entertainment and communication to hand-held devices.

The Global Silicone Insulator Market Size was estimated at USD 1140.02 million in 2023 and is projected to reach USD 1385.20 million by 2029, exhibiting a CAGR of 3.30% during the forecast period.
