Report Overview

Silicone resin is a thermosetting polysiloxane system with a highly cross-linked structure, mainly composed of organochlorosilane or corresponding organic alkoxysilane as raw materials. After hydrolysis condensation and thickening rearrangement, it is made into a stable active siloxane prepolymer at room temperature. When in use, it is directly heated or cross-linked through catalytic condensation to form a hard or less elastic solid silicone resin. According to its structure, it can be roughly divided into methyl silicone resin, phenyl silicone resin, methyl phenyl silicone resin, methyl vinyl silicone resin, etc. The main side group of silicone resin molecules is methyl, which can be cured through various methods such as condensation, platinum catalyzed addition, peroxide crosslinking, etc.
