## Abstracts

Silicon rings for etching machine are mainly used on 8-12 inches (i.e., 200mm-300mm) plasma etcher. In the manufacturing process of integrated circuits, high-purity silicon components and wafers are made of silicon, which makes the electrical properties of etching more uniform, so silicon rings are widely used in semiconductor etchers. The periodic consumption of silicon ring products has become an important consumable component in the wafer processing process, which directly affects the electrical properties of the wafer. The main technical requirements of the silicon ring include electrical parameters (i.e., conductivity type, resistivity, and radial resistivity change), geometric size, crystallographic orientation, and degree of deviation from crystallographic orientation, oxygen content, carbon content, crystal defects, surface quality, surface roughness. South Korea is the largest producer, holds a share around 29%, followed by North America and China.

The global Silicone Rings for Etching Machine market size was estimated at USD 419.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.20% during the forecast period.
