Report Overview

Silicone rubber keypads are made using a high temperature compression molding process that allows an angled webbing to be formed around each switch. The webbing deforms uniformly upon actuation, creating a tactile response. Once pressure is removed, the webbing returns to a neutral position, providing positive tactile feedback. Electronic switches are made using carbon or gold pellets placed on the underside of the switch, which contact the PCB as the webbing deforms. With a wide operating temperature range, long life, strong sealing capabilities, and the ability to adjust the tactile response to meet end-user expectations, silicone rubber keypads are a cost-effective interface solution.
