Abstracts

A silver amalgam alloy is a metallic restorative material composed primarily of silver, tin, copper, and sometimes zinc, which is mixed with mercury to form a pliable mass that can be condensed into a prepared cavity in a tooth; once placed, it hardens into a durable, long-lasting filling capable of withstanding mastication forces, though its use has declined significantly in recent decades due to concerns over mercury toxicity, aesthetics, and the rise of tooth-colored alternatives like composite resins and glass ionomer cements.

The global Silver Amalgam Alloys market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -2.30% during the forecast period.
