Abstracts

Silver coated copper powder is generally a composite material with a silver plated surface and a copper core, which is uniformly coated with a layer of silver on the surface of the copper powder through chemical transfer. It is a good high conductivity filler that maintains the excellent conductivity of copper powder and silver powder, while overcoming the defects of silver powder migration and copper powder oxidation during use. Therefore, it can be used as a substitute for silver powder in certain fields. By adding it to polymer materials such as coatings (paints), adhesives (adhesives), inks, pulp, plastics, rubber, etc., various conductive and electromagnetic shielding products can be made, which are widely used in the fields of conductivity and electromagnetic shielding in industrial sectors such as electronics, electromechanics, communications, printing, aerospace, weapons, etc. Conductive and electromagnetic shielding of electronic, electrical, and communication products such as computers, mobile phones, electronic medical equipment, and electronic instruments. However, the traditional method of preparing silver plated copper powder generally has poor silver plating effect, making it difficult to form a dense and uniform coating layer. In addition, the conductivity of silver plated copper powder is poor, and the amount of silver powder used as a substitute is low, which needs to be improved. With the rapid development of industries such as electronics, communication, aerospace, etc., silver plated copper powder, as an important conductive and decorative material, continues to grow in market demand. It is expected that the market size of silver plated copper powder will continue to expand in the coming years. The industrial chain will further develop towards high-end and intelligent direction. Through technological innovation and industrial upgrading, the performance and quality of silver plated copper powder will be further improved, meeting the market's demand for high-quality products. With the technological advancement of the photovoltaic industry, N-type iteration is the trend. Compared to TOPCon and Perc, the cost of HJT technology is still relatively high, with silver paste

being the largest non silicon cost. Therefore, silver coated copper paste is a necessary path for HJT to reduce costs. It is expected that 129GW of HJT production capacity will be implemented by the end of 2026, driving a rapid increase in demand for HJT silver paste. It is expected that the demand for HJT silver coated copper powder will reach 974.54 tons by 2025.

The global Silver Coated Copper Powders market size was estimated at USD 983.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
