The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Silver Copper Composite Strip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Silver copper composite strip uses composite technology to physically bond silver or silver alloy with copper or copper alloy. The bonding strength is called welding bonding strength, which effectively utilizes the electrical performance advantages of silver or silver alloy. At the same time, copper or copper alloy is used to save precious metal materials and reduce material costs. Silver copper composite strip is mainly used for the production of various electronic components such as micro motor commutators and brushes, lead frames, micro switches, connectors, relays, tuners, temperature controllers, etc. Silver copper inlaid composite strip is a type of strip that is locally embedded with corresponding silver or silver alloy on a copper or copper alloy substrate, achieving the goal of saving precious metals while meeting performance requirements. It can be single-sided inlay or front and back inlay; It can be a single inlay or multiple inlays, and its structural form can be adjusted according to needs. Silver copper surface composite strip is made of copper and copper alloys as the matrix, with silver or silver alloys corresponding to the surface composite as the conductive contact layer. The other side can be composite with materials that meet welding performance requirements, such as iron, stainless steel, etc., if required, to achieve the goal of saving precious metals and facilitating welding. Its structural form is generally two or three layers.

The global Silver Copper Composite Strip market size was estimated at USD 116.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
