Abstracts

A silver resistor cermet paste is a specialized composite material used in the fabrication of thick-film resistors, typically applied via screen printing or similar deposition methods onto ceramic or other insulating substrates before being fired at high temperatures to form a durable, conductive-resistive layer. This paste consists of a finely dispersed mixture of silver (as a conductive phase) and ceramic or glass frit (as an insulating and binding phase), often with additional modifiers to precisely tune electrical properties such as sheet resistance, temperature coefficient of resistance (TCR), and long-term stability. It is predominantly employed in the electronics industry for manufacturing hybrid integrated circuits, sensors, automotive electronics, and various precision resistors where performance consistency, miniaturization, and reliability under thermal and environmental stress are critical.

The global Silver Resistor Cermet Paste market size was estimated at USD 145.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
