Abstracts

Simulated cellular repeaters, also known as signal boosters or amplifiers, are electronic devices designed to capture weak existing cellular signals from outside a building, amplify them, and then rebroadcast the enhanced signal indoors to improve call quality, data speeds, and overall network reliability in areas with poor coverage. These devices typically consist of an external antenna to receive the signal, an amplifier unit to boost it, and an internal antenna to distribute the strengthened signal within the desired area, effectively mitigating issues like dropped calls and slow internet without requiring a subscription or ongoing fees from cellular carriers.

The global Simulated Cellular Repeater market size was estimated at USD 125.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
