Abstracts

The simulated mastoid is a device that simulates the force impedance of the average human mastoid, on which bone conduction headphones can be applied to calibrate the headphones. The mastoid, or mastoid bone, is a conical protrusion on the temporal bone on both sides of the head, and the simulated mastoid is a mechanical coupler specially made to imitate this physiological feature. The simulated mastoid is mainly used to calibrate the bone conduction microphone added to the mastoid, as well as to evaluate the performance of hearing aids and diagnose ear diseases. In hearing tests, the simulated mastoid can provide a standard and repeatable test environment to ensure the accuracy and reliability of the test results. The simulated mastoid device was first proposed by Hawley in 1939, and the first simulated mastoid was successfully developed by Weis in 1960. With the development of science and technology, the design and manufacturing level of simulated mastoids is also constantly improving to meet the growing needs of hearing tests and calibration.

The global Simulated Mastoid market size was estimated at USD 135.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
