Abstracts

Simulated pressure gauges are specialized instruments designed to replicate the functionality and visual output of actual pressure gauges without requiring a physical pressure source, primarily serving calibration, testing, training, and diagnostic purposes across industries where pressure measurement systems are critical. These devices generate simulated electrical signals or digital outputs that mimic the behavior of real pressure sensors or transducers, allowing technicians to verify the accuracy, responsiveness, and integration of pressure monitoring equipment?such as controllers, data acquisition systems, or safety interlocks?in a controlled and repeatable manner. By eliminating dependency on live pressure systems, they enhance safety, reduce downtime, and improve efficiency in settings ranging from manufacturing and oil and gas to aerospace and laboratory environments.

The global Simulated Pressure Gauges market size was estimated at USD 105.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
