Abstracts

A single axis linear motor is a direct drive electromechanical actuator that converts electrical energy directly into linear motion without intermediate mechanical transmission components such as lead screws, belts, or gears, differing from traditional rotary motors by producing force and movement along a straight line rather than rotational torque. These motors typically consist of a stationary primary part (stator) containing windings and a moving secondary part (forcer or slider) incorporating permanent magnets, operating on principles derived from Lorentz force law to generate precisely controllable, high-speed, and high-acceleration motion with minimal friction, backlash, or wear. They are characterized by their simplicity of design, high positioning accuracy, repeatability, smooth operation, and ability to achieve velocities and accelerations unattainable by conventional systems, making them ideal for applications requiring rapid, precise, and dynamic linear positioning.

The global Single Axis Linear Motor market size was estimated at USD 528.9 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
