Abstracts

A single axis servo controller is an electronic device that precisely regulates the position, velocity, and acceleration of a single servo motor by processing feedback from an encoder or resolver and adjusting the output signal to minimize error between the desired and actual motor performance. These controllers are integral to motion control systems, providing closed-loop control that ensures high accuracy, repeatability, and dynamic response in applications requiring precise mechanical movement, such as robotics, CNC machinery, automated manufacturing equipment, and precision instrumentation. They typically interface with higher-level systems like PLCs or PCs through communication protocols such as EtherCAT, CANopen, or Modbus, and are designed to handle specific motor types, including brushless DC, brushed DC, or AC servo motors, with features like torque control, jerk limiting, and programmable motion profiles tailored to the demands of industrial automation and high-performance applications.

The global Single Axis Servo Controller market size was estimated at USD 890.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
