## Abstracts

Single-beam sonars use a single transducer to transmit and receive acoustic energy signals, or "pings". There are two types of single-beam sonar, profiling and imaging. Imaging sonar is primarily used for visual interpretation and uses a fan-shaped acoustic beam to scan a specified area or target. Profiling sonar is primarily used for quantitative measurements where a narrow, conically shaped beam generates a single point for each ping. With single-beam scanning sonar, the smaller and narrower the horizontal beam, the better the resolution.

The global Single-beam Imaging Sonar market size was estimated at USD 580.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Single-beam Imaging Sonar market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
