Report Overview

By integrating photoelectric positioning technology and microfluidic technology, the single-cell light guide system realizes high-throughput single-cell-based cell biology research in the nano-scale chamber of the chip. The single-cell light guide system can directly manipulate and culture a single target cell from the beginning of the experiment, with reliable results and high efficiency. This system combines the unique OptoElectroPositioning technology (OptoElectroPositioning) with a novel nanofluidic design. It can not only accurately select single cells on a chip, but also directly culture them, and use multiple cells in real time without interruption. Different channels, detect cell state, perform various experiments on single cells or single clones, and derive the required target cells and target clones according to the specific results read during the experiment.

The global Single Cell Photoconductive System market size was estimated at USD 285.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.65% during the forecast period.
