Abstracts

Single-cell RNA sequencing service is a technology based on RNA analysis at the single-cell level. It uses high-throughput sequencing to detect gene expression in individual cells, widely applied in studying cellular heterogeneity, developmental processes, and disease mechanisms. North America, with its leading position in biotechnology research and clinical applications, has long been the main driver of the global market; Europe maintains stable demand thanks to its mature research system. The Asia-Pacific region is experiencing the fastest growth, with market demand in countries like Japan and South Korea, in addition to China, continuing to be released under policy support. Latin America and other emerging markets are gradually releasing demand, becoming an important source of incremental growth for instrument exports. Initially, this service mainly focused on basic research fields such as cancer, immunology, and neurology, used to reveal tumor heterogeneity and neuronal interactions. Now, it is rapidly being translated into clinical applications, with surging demand in areas such as early cancer screening, preimplantation genetic screening, and drug development. For example, the annual growth rate of related contracts with pharmaceutical companies exceeds 40%; Berry Genomics' single-cell methylation detection technology has obtained a Class III medical device registration certificate from the NMPA, entering the tumor liquid biopsy market.

The global Single Cell RNA Sequencing Service market size was estimated at USD 1826.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.90% during the forecast period.
